

Issues I Found & How I Planned to Fix Them

Wireframe: [wireframe.png](#)

Before fixing anything, I ran all 4 pages and the CSS through the W3C validators and went through the code myself for things the validator wouldn't catch, like accessibility problems.

What I found:

1. None of the pages had a meta charset tag (validator error) - I'll add one to each head.
2. The html tag was missing lang="en" on every page (validator warning) - I'll add it.
3. There was no viewport meta tag - I'll add one.
4. 5 images had no alt text at all (validator errors) - I'll add proper alt text to each.
5. The CSS was linked to css/styles.css, but the actual file is styles.css in the root - I'll fix that link.
6. There was no nav menu anywhere - index.html had a comment admitting it was missing - I'll build a nav with links to all 4 pages.
7. The starter code used div class header and div class footer instead of real semantic tags - I'll switch these to header, main, section, and footer.
8. about.html was supposed to have a skills table but it was just a paragraph with a comment - I'll build a proper table with thead/tbody.
9. projects.html only had 2 of 3 required projects - I'll add the third.
10. The contact form had no labels - I'll add label tags connected with for/id.
11. The form only had text inputs and a textarea - I'll add email, select, and radio types.
12. No form validation - I'll add required, pattern, and other HTML5 attributes.
13. No images folder, so every image link was broken - I'll create it and add real images.
14. CSS only used 2 selector types - I'll add ID, descendant, and pseudo-class selectors.
15. No hover or focus states anywhere, including the nav - I'll add those.
16. The box model was barely used - I'll use margin, padding, and border properly.
17. The footer was left-aligned instead of centered (a comment in the CSS pointed this out) - I'll fix it with text-align center.
18. The table and form had no styling - I'll add borders, spacing, and alternating rows.

My approach: fix the structural/semantic HTML first, then fill in missing content (table, 3rd project, form fields), then rebuild the CSS, re-running the W3C validators after each change.
