

Issues I Found & How I Fixed Them

Wireframe: wireframe.png

I ran all 4 HTML pages and the CSS file through the W3C validators and read through the code myself to catch extra issues the validator wouldn't (like accessibility problems).

What I found:

1. No `<meta charset>` tag on any page (validator error) - added `<meta charset="UTF-8">` to each `<head>`.
2. Missing `lang="en"` on `<html>` (validator warning, all pages) -added it.
3. No viewport meta tag -added for mobile responsiveness.
4. 5 images had no alt text (validator errors) - added descriptive alt text to all.
5. CSS linked as `css/styles.css` but the file is `styles.css` in the root -fixed the path.
6. No navigation menu at all (index.html had a comment saying so) -built a `<nav>` with links to all 4 pages, added to every page.
7. Generic `<div class="header">/<div class="footer">` used instead of real tags - swapped for `<header>`, `<main>`, `<section>`, `<footer>`.
8. about.html was missing its skills table (commented as missing, just a paragraph instead) - added a proper table with `thead/tbody`.
9. projects.html only had 2 of 3 required projects -added the third.
10. Contact form had no `<label>` tags -added labels linked with `for/id`.
11. Form only had text inputs and a textarea - added email, select, and checkbox inputs to meet the 5+ type requirement.
12. No form validation -added `required`, `pattern`, and other HTML5 validation attributes.
13. No images/ folder, so image links were broken - created the folder and added real images.
14. CSS only used 2 selector types - added ID, descendant, and pseudo-class selectors.
15. No hover/focus effects anywhere, including nav - added for accessibility and UX.
16. Box model barely used - applied margin/padding/border consistently.

17. Footer was left-aligned instead of centered (flagged in a CSS comment) -fixed with text-align: center.

18. Table and form had no styling -added borders, spacing, alternating rows, visual hierarchy.

My approach: Fixed structural/semantic HTML first, then filled in missing content (table, 3rd project, form fields), then rebuilt the CSS. Re-ran the W3C validators after each major change to catch new errors early.
